

# Assessing the Quality of Mobile Phone Data as a Source of Statistics

Session 20 – Big Data Oriented Systems 02/06/2016

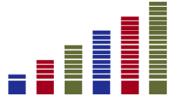

#### **Focus**

## Use mobile phone data as a measure of resident population

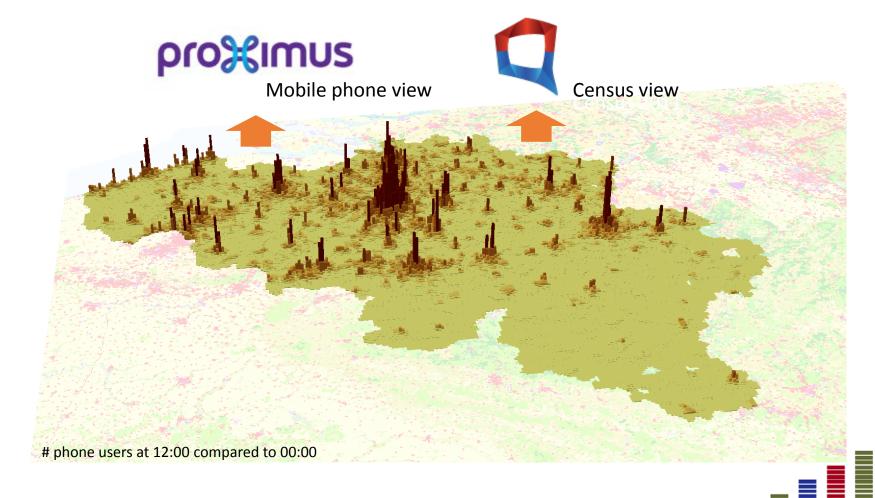

- Validity
- Accuracy
- How to increase value further

=> Comparison with census 2011

#### 2 versions of the truth

#### Mobile phone data

Use of network signalling vs Call Data Records
Abstraction of network complexity (TACS - Technology
Agnostic Cell Sector)

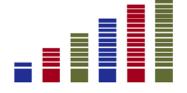

#### Census data

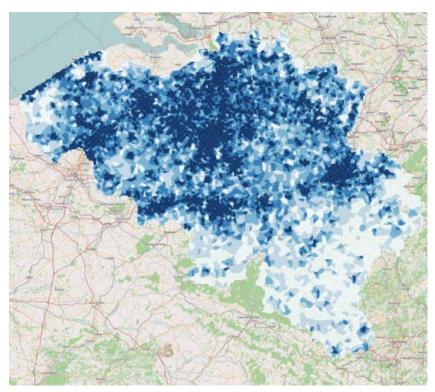

#### Place of residence Geocoding of addresses to Voronoi / grid

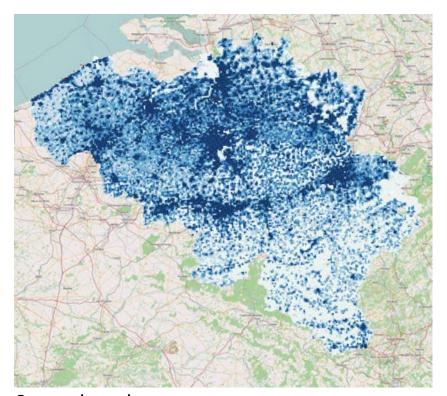

#### Results for population density

Mobile phone data based

1 day @ 04:00

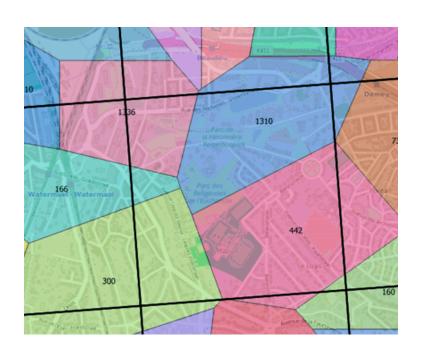

Census based

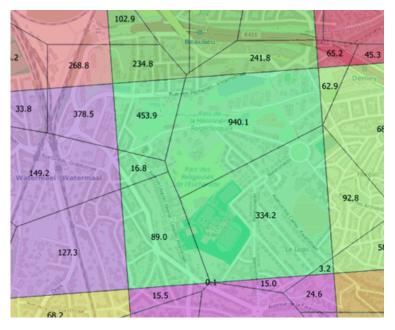

2011 data

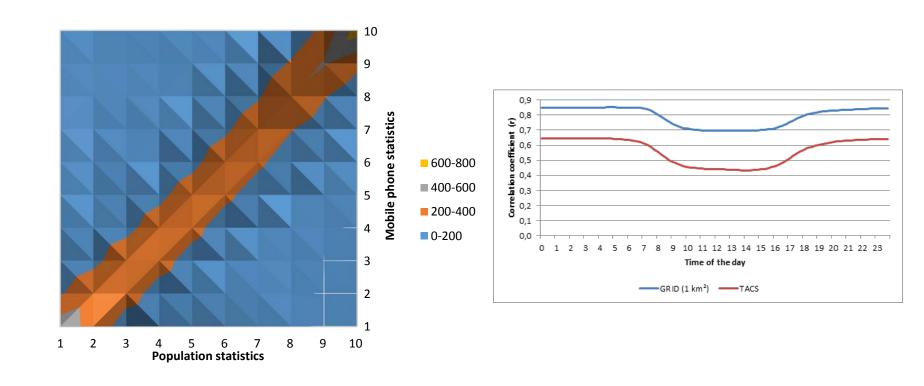

#### Mapping to grid

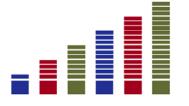

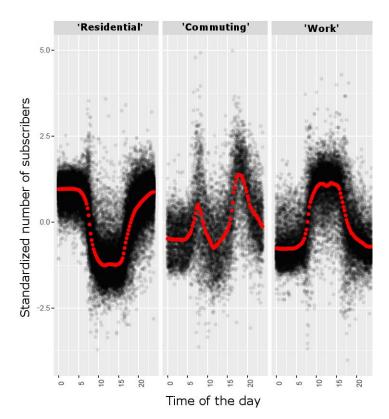

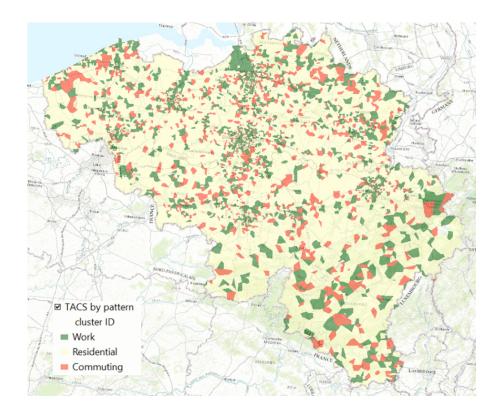

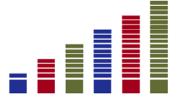

### Cell traffic profiling

#### Conclusions

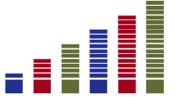

Mobile phone data is a valid & accurate approximation of actual present population

- Available, huge, 24/24 7/7, objective
- Largely unexplored

A large potential for future research in many area

- population
- tourism
- migration, transport & mobility
- ...

Opportunity for efficient & coherent use of 1 source for different purposes
