Spain in figures 2000

Foreword

Madrid, 2000

The National Statistics Institute presents a new edition of *Spain in Figures* for 2,000.

This publication offers users a wide panorama of Spain, as well as a comparative vision of our environment. The publication includes the most significant and latest data about demographic, social and economic issues, put forward in the most interesting way and using statistical tables, graphics and comparative charts. It also includes short methodological notes about the statistics produced by INE, further reading for more detailed information, and when data are supplied by other institutions the source is stated in all cases.

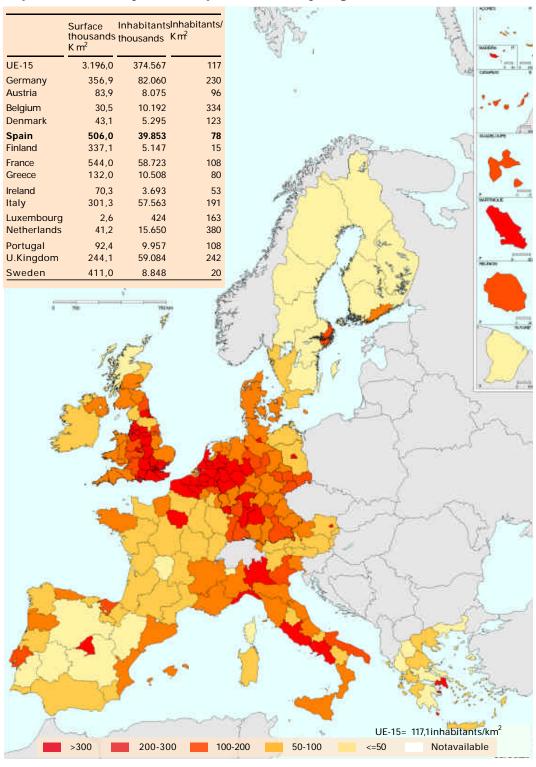

More detailed information about this publication as well as any other statistical issues are available through INE's website, www.ine.es. Our web site contains a time series databank, Tempus, and our new database INEbase, where almost all of our statistical data are available on-line.

We hope to receive as good an acceptance as in previous years, and we thank all those persons, bodies and companies whose collaboration has been essential for the production of this issue of *Spain in Figures*.

Population Censuses and the Municipal Register are the only sources for obtaining population figures of an official character.

Population Censuses

This statistical operation is very traditional in Spain, with the first Spanish Census dating from 1769. It is conducted every ten years and it provides information on the basic structure of the population (sex, age, and residence), as well as other cultural, economic and social characteristics of the population with reference to a specific period.

According to legislation currently in force, the next Population and Households Censuses will be carried out in the year 2001.

The Municipal Register

This is the administrative register where all residents are inscribed. The Town Councils are responsible for creating, maintaining, revising, and keeping this Register. Its revision is carried out every January 1^s.

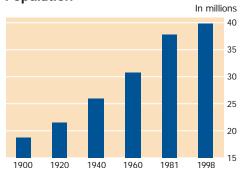

In 1996, an amendment to the Law was made which standardised a continuous computerised administration of the Municipal Registers subject to the INE's co-ordination. The revision dated January 1, 1998 was the first to be carried out under the new system.

The new system permits the collection of official population figures annually, instead of every five years as previously published.

Vital Statistics

These statistics track the number of births, marriages, and deaths that have occurred. They have a longstanding place in Spain's history. The Kingdom's General Council of Statistics published the first volume in 1863, with figures from 1858 to 1861 taken from the parise registers. Since then they have been published annually, except between the years of 1871 and 1885, the period in which the Register of Births, Deaths and Marriages was being created.

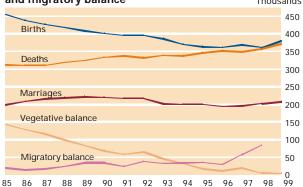

These statistics are obtained from the information contained in the births, marriages, and deaths forms, which are completed at the Registry whenever one of these events takes place.

Migrations

Statistics on Change of Residence are produced by the INE, and are obtained through statistical analysis of the personal records information located in the Municipal Registers of inhabitants who have changed residence. This operation supplies data on the number of internal migrations in a year, among the different municipalities of Spain, and the migratory flow coming in from abroad.

These are statistics with a longstanding tradition in Spain. They have been produced since 1961, regarding the internal migratory flow, whose scope was enlarged in 1981 to include entries into the country from abroad.

Migrations are classified by sex, place of birth, nationality, academic qualifications, and destination and origin of the migration.

Data on Spanish emigration are taken from the Ministry of Labour and Social Affairs, and those on foreigners resident in Spain are taken from the Registry of Foreign Residents at Police Headquarters, which is generated from the residency permits granted to foreigners.

Spanish population projection

Population projection involves the calculation of future population sizes. The projections are made for the coming thirty years for the country as a whole and for the next fifteen years for the autonomous communities and the provinces. Populations are calculated by sex and age; for the country as a whole, the ages are simple up to 100 years and over, for the autonomous communities ages are simple up to 85 years and over; and for the provinces they are five-year groups up to 85 and over.

U. Kingdom

(P)Prov. figure

(E) Estimated Eurostat

Sweden

The method employed to obtain the population projections is the *by components* method which basically relys upon the following scheme: taking the population residing in a certain geographical area and with a given age structure, and at a given moment, usually taken from a census, the future population is obtained applying given hypotheses or assumptions about the trend of mortality, fertility and migration.

The results obtained will be close to reality, provided the starting age structures are so and the hypotheses used to make the calculations are confirmed. These hypotheses are based on the analysis of the three above mentioned demographic events, which is done by examining the temporary evolution of the respective indicators.

The Consumer Price Index (CPI)

This statistical measurement of the evolution in the overall prices of goods and services consumed by the population living in family dwellings in Spain.

Since 1939 the Official Statistics Office of Spain has obtained the Consumer Price Index. The first measurement was based on the July 1936 annual average and then on the averages from 1958, 1968, 1976, and 1983 up to the current system which is based on the annual average from 1992.

The basic information about household expenditure on consumer goods and services, was taken from the Household Budget Survey (HBS), 1990-1991. 471 articles (classed in 8 groups) were selected from over 900 HBS expense items, whose price evolution represents the evolution for all consumer goods and services. This set of goods is commonly known as the "shopping basket".

The index is produced from some 150,000 prices taken from the information given by some 29,000 establishments in 130 municipalities.

These indices are calculated for Spain, 17 autonomous communities, 50 provinces, and Ceuta y Melilla as a whole.

The Household Budget Continuous Survey (HBCS)

The Household Budget Continuous Survey, started by INE in January 1985, provides quarterly and annual information on the origin and amount of households incomes, and the way they are used in several consumption expenditures.

Consumption expenditures recorded in the Survey relates to the monetary flow that the household and each one of its members use for the payment of certain goods and services, considered as final consumption goods and services. It also relates to the value of goods perceived for self-consumption, self-supply, wage in kind, free or discounted meals and rent imputed to the dwelling in which the household is

living (when it is owned or it has been rented free of charge or almost free of charge to other households or institutions).

The Survey was significantly revised in the third quarter of 1997 in both the methodology and the collection system. The increase of the sample size now allows estimations to be done for autonomous communities also.

The sample is composed of almost 8,000 households and approximately 4,000 of them collaborate during one week in the quarter by writing down all the goods and services paid for in notebooks. Information on purchases carried out with greater regularity than once a week is also collected in an interview. Every quarter, an eighth of the sample is renewed so each

household participates during a maximum of eight quarters.

The main criterion used to evaluate the expenses is that of purchases, that is to say that they are gathered at the moment of consumption of the good or service by the households, regardless of whether they have been paid for in cash or not.

European Union Household Panel

This is a statistical source of information for the European Union. Its objective is to provide the European Commission with an instrument for observation and following of life conditions during the convergence process to political and monetary union.

The survey, which started in 1994, is developed in annual cycles and it is directed at a fixed panel. Persons that form the initial sample are studied over different cycles, allowing for entrance of new members and following those that have left home, or the home as a whole, if they change residence inside the E. U.

Gross rate of schooling per educational class.

is defined as the ratio, in percentage, of the pupils of any age enrolled in each schooling class, over the population aged in the bracket indicated for each class.

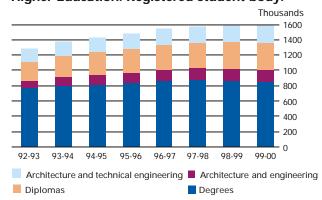

For further information

- Higher Education Statistics in Spain. Series of all levels. Annual publication since the course of 1992-93
- University acces Test Statistics. Detailed results
- First and second cycle Higher Education. Enrolled pupils and their evolution

INE has been carrying out - since the 1945-46 academic year and up to the 1984-85 academic year - the statistics corresponding to all teaching levels in the Spanish educational system. Since the 1985-86 academic year the Ministry of Education and Science, in agreement with the INE, has assumed the functions of collecting, processing, and publishing of results for primary and secondary levels. On the other hand, INE retained the responsibility of elaborating and publishing the Higher Education Statistics (University and Higher Non-University studies)

The objective of Higher Education Statistics is to obtain knowledge about the most significant characteristics of pupils (newly enrolled, enrolled pupils that completed their studies, broken down by sex and age), teaching force and centres, that allows a general vision of the scope and volume of Higher Education in Spain.

Book publishing statistics

These statistics are produced every year since 1965, adapting to the UNESCO recommendations on the international standardisation of book publishing statistics (1964, 1979 and 1985).

Its objective is to inform about the number and characteristics of books and pamphlets printed in Spain by foreign editorials, as well as those published in the country by Spanish editorials.

The unit of analysis is books and pamphlets, where the number of pages distinguishes books from pamphlets. Books having 49 or more pages, and pamphlets having between 5 and 48 pages. Data is obtained on the number of titles and copies classified by subjects, publication languages and language of original text, price per copy, edition, etc.

Library Statistics

These statistics cover the number of libraries and points of service existing in Spain, as well as their funds, movements, equipment, personnel, activities, and expenditures. This study is carried out by type of library, and by autonomous community and province.

The investigation is carried out every two years. The scope of these statistics covers all libraries established in Spanish territory, regardless of their administrative dependence, except the private ones that deny public access.

This data is compiled by directly contacting each library, as per UNESCO recommendations on the International Standardisation of Library Statistics (1970).

The INE has produced these statistics since 1960. They were restructured in 1972 to adjust to UNESCO recommendations.

Hospital Morbidity

The basic objective of these statistics is to determine the structure and evolution of morbidity occurred in hospitals. The information collected permits an estimation of the number of patients discharged and their average length of stay in the hospital, classified by sex, age, and reason for admission, urgency of admission and final diagnosis. The results are obtained nationally, provincially and by autonomous communities.

The INE has been collecting statistics about morbidity occurred in hospitals since 1951 although the methodology that is applied today was modified in 1977. The scope of the survey is national, and covers all hospitals whether state-owned, private, or military. The sample includes 75% of all hospitals, and information

is collected on approximately 45% of the patients discharged from these hospitals.

Death by Causes of Death

The objective is to attain the number of deaths and late foetal deaths occurred within Spain during the year of reference, considering the basic cause of death, in accordance with the World Health Organisation. Deaths are classified by sex, age, residence and month death occurred, thus obtaining results at national, autonomous community and provincial levels.

The classification of deaths by cause of death began during the ten year period from 1861 to 1870, giving origin to what today is known as Death Statistics by Cause of Death. The information is obtained from the Death and Birth Statistics Bulletins completed at Civil Registries.

Wages Survey

The Industry and Service Wages Survey (ES) is a short-term statistical operation whose objective is to supply information about the level and tendency of average earnings per hour, per worker and month, and the average number of hours worked.

The sample is the group of wage earners working at centres with 5 or more workers, located in Spain, regardless of contract modality and working day. Some 9,500 establishments pertaining to 45 branches of economic activity from industry, construction and services are surveyed each quarter.

The survey supplies information about the average number of hours worked per month per worker. As well as, the average earnings per hour worked and the average earnings per month per worker sorted by working day, professional category, branch of activity, CNAE division and sector of activity, at a national level and by autonomous communities. In the fourth quarter of each year the survey supplies this information broken down by sex as well.

Active Population Survey (EPA)

The survey's main objective is to collect quantitative data on the economic activity of the population by sex, age, education level, occupation, etc.

EPA, conducted since 1964, is a continuous quarterly sample survey, targeted at family dwellings. The sample size is approximately of 66,000 dwellings, which means obtaining information from about 200,000 people. Data is collected by means of personal interviews.

Terms used:

Employed: Anyone aged 16 or over who worked for payment during the reference week; or having work, but was temporarily absent on sick leave, holidays, etc.

Unemployed: Anyone 16 or over with no job, that were available to work and sought employment during the reference week.

 ${\it Population counted separately:} Anyone 16 or over doing military service or some substitute community service.$

 $\it Inactive: Anyone 16$ or over not included in the previously mentioned categories.

Judicial Statistics

These statistics describe the activity of the Courts and Tribunals all over the country, except Labour Courts and Military Criminal Courts.

The information is collected by means of bulletins completed by the Courts and Tribunals on a monthly, quarterly or biannual basis, as the case may be.

Judicial Statistics have been published annually since 1952 and supply data sorted by province, classified according to activity and other variables such as: number of processed matters, number of sentences, types of offences, sentences passed, convicts, etc.

Breakdown of Enterprises operating by sector of the economy

Central Businesses Directory (DIRCE)

The DIRCE unites all Spanish enterprises. including their local units situated within the national territory, into one single information system. It's basic objective is to facilitate economic surveys through sampling. It also has other objectives:

- To supply structural data on the number of firms and premises in Spain classified by principal economic activity, employee brackets and legal status.
- To offer data on business demographics concerning the number of new, operating and closed down companies.
- To satisfy the informational demands of international organisms, particularly the European Union's Statistical Office (EUROSTAT).
- To establish a control that will streamline and minimise the supply of primary statistical information by companies as much as possible.

The DIRCE contains the following basic data: identity of the unit, location and main economic activity according to the 1993 Classification of Economic Activities (CNAE-93) and employee

The DIRCE is a project that the INE has been developing since 1989.

Statistical Study of Scientific Research and Technological Development Activities

Their main objective is the measurement of resources destined for R&D by the four institutional sectors into which the economy is divided: companies, public administrations, higher education and non-profit making private institutions. To such an end, expenses in R&D (by branch of activity, scientific field, type of research and financing) and personnel employed in R&D (researchers, technicians and assistants) are studied both by number of persons as well as by equivalence to full dedication.

This statistic is collected exhaustively on an annual basis. In odd reference years, complete information on the units researched is collected, and in even reference years the basic indicators as well as the Innovation Survey are collected in the corporate sector.

Expenditures in innovation with respect to turnover 1998

Technological Innovation in Enterprises Survey

It's main objective is to supply information about the process of innovation in industrial companies, producing indicators that account for different aspects of the process. The main variables investigated are expenditure on innovation and its allocation to different innovative activities, and the economic impact of the innovation

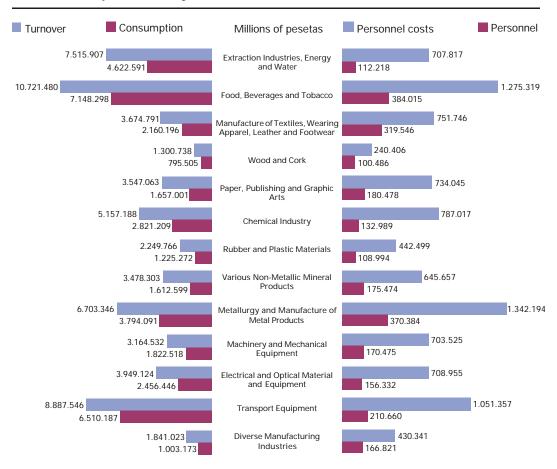

This survey is conducted every two years. It targets a sample of some 10,000 industrial companies with one or more paid employees. Companies with 200 or more employees are surveyed exhaustively.

Industrial Products Survey

Its objective is to ascertain output (amount and value) of different industrial goods. It is a continuous, annual survey covering the whole country, except Ceuta and Melilla.

The basic unit is the industrial establishment. The information surveyed is defined using the PRODCOM list (Community Production). This list is harmonised with the Foreign Trade Classification with more than 5,000 products and industrial services.

Industrial Companies Survey

Its objective is to supply information on the principal structural characteristics and activities of the different sectors which constitute the economy's industrial activity.

The survey has been conducted since 1993 for the whole nation, except Ceuta and Melilla. The survey is targeted at industrial companies with one or more salaried employees, whose main activity falls within any of the following: mining, manufacturing, production, and distribution of electricity, gas and water. Companies with 20 or more employees are surveyed exhaustively, whereas the remaining companies are surveyed by sampling. In total, some 40,000 companies are surveyed every year, approximately.

Results are obtained about occupied personnel, turnover, sales, consumption, etc., broken down by autonomous community and branch of activity.

Industrial Production Index (IPI)

This short-term indicator measures monthly evolution of production volume for industrial branches, with the exception of construction, contained in the National Classification of Economic Activities (NCEA-93). It therefore measures the combined evolution of quantity and quality, eliminating the influence of prices.

The information is obtained from a continuous monthly survey targeting industrial establishments. The sampling consists of more than 9,000 establishments.

These indices are calculated on a national level, and by autonomous communities, for the industry as a whole and for the industrial sectors as per the National Classification of Economic Activities. These indices are also presented by economic use of goods.

Industrial Prices Index (IPRI)

This short-termindicator's objective is to measure the monthly evolution of prices of industrial goods manufactured and sold within the country at the first phase of commercialisation. That is to say the wholesale price upon leaving the factory, excluding transportation and commercialisation costs as well as invoiced VAT. This index covers all industrial sectors, except construction.

This index is obtained from a continuous monthly survey, which covers more than 6,000 industrial establishments monthly.

Number of farms as per UAA

Agricultural exploitations structure survey

European Community Council regulation number 70/66 establishes the obligation of all member states to conduct surveys on farm structures. This allows the collection of objective and comparable information on the situation of agriculture in their countries, necessary for a common agricultural policy.

The main objectives of the 1997 survey are:

- To obtain information compatible with that demanded by the E.U.
- To know the current structure and evolution of the agricultural sector as compared with the 1989 agricultural census and earlier surveys.

The survey is conducted all over the country and it takes the 1997 agricultural year as a reference. The information units are farms that meet the following conditions concerning the Agricultural Census of 1989: they have at least 1 Ha. Of Agricultural Area in Use (UAA), they have at least 0.2 Ha. dedicated to vegetables, flowers, greenhouse crops, irrigated fruit trees or nurseries and they have livestock units (LU) with a Total Gross Margin equal to or greater than 0.75 European Dimension Units (EDU).

Annual Services Survey

Its main objective is to study the structural and economic characteristics of services sector companies, the most important sector of the economy in terms of Gross Domestic Product and employment creation. In order to achieve this objective information is collected about main activity, legal status, period of activity, premises, employment structure and countable data, such as purchases and expenses, revenues, capital transactions and taxes.

With the 1998 survey a new period began in the study of the services sector, whose objective was to offer a total vision of this sector in two

years. Since then, an Annual Services Survey has been elaborated each year, offering a complete description of the entire sector each year and allowing the study of its main economic variables.

In 1998 all companies related to tourism (hotels, restaurants and travel agencies), to transport of travellers (train, subway, urban and inter-urban buses and sea and air transport), to the information society (telecommunications and computer services), to services rendered to companies (research and development, market studies, advertising, selection and recruitment of personnel and industrial cleaning services) and

to services rendered to the community (public health activities) have been investigated.

This investigation is carried out in the entire country. The Survey's reference period is 1998 and employment data are requested with reference to September 30, 1998.

Wholesale Trade Survey 1998

The Wholesale Trade Survey 1998 is part of the pluri-annual statistics that establishes the Community Regulation for Structural Statistics for Companies (58/97).

This Survey exclusively studies those companies whose main activity is wholesale trading or commercial brokering (division 51 of NCEA-93).

The information collected refers to the structural characteristics of companies, their economic activity, revenues, expenses, investment and employment.

The Survey's reference period for economic variables and countables is the 1998 fiscal year. Employment data refers to September 30, 1998.

Hotel Occupancy Survey

Its main objective is to supply information about the demand and supply of accomodation services in hotels.

The survey is carried out monthly for the whole national using an approximate sample of 6,000 establishments in winter and 7,500 in summer. The analysis units are hotel establishments: hotels, inns, apartment hotels and motels with categories of 1 to 5 gold stars and inns and pensions of 1, 2 and 3 silver stars. Information is obtained on the number of travellers and their origin, overnight stays, avera-

Double room rate according to tarif

ge stay, number of open establishments, categories and beds, degree of occupancy per bed, personnel employed and average price per room.

Statistics on Travellers Transports

In order to obtain information on the volume of travellers transported, the INE carries out the Travellers Urban Transport Statistics and the Travellers Regular Transport by Road Survey.

Travellers Urban Transport

This statistic's objective is to provide information on the number of travellers transported by metropolitan companies and by urban bus companies. It is carried out exhaustively every month based on the information provided by all private and municipal companies that operate in the sector of urban transport of travellers in Spain.

Regular Transport of Travellers by Road

This survey is elaborated based on information the INE collects each month from a sample of approximately 350 companies, spread over the entire nation, whose main activity is the regular transport of travellers by bus and who are spread out over the whole country.

The INE has also been carrying out annual structural and periodical statistical investigations directed at companies dedicated to the public transport of travellers, both urban (buses and underground) and inter-urban (road, rail, air and sea) since 1991. Information is collected about the structure of the companies

and the activity undertaken during the reference period.

Mortgage Statistics

These statistics provide information about the number of mortgaged goods and the amounts disbursed when the corresponding mortgages are formalised.

These are monthly statistics based on the information provided by the Property and Mercantile Registers throughout the entire country. The information refers to chattel mortgages (trade establishments and others), property mortgages (dry and irrigated land, built houses, plots, planned houses and others) and vessels (merchant and fishing).

Mercantile Companies

Its main objective is to determine the number of companies created and their registered and paidout capital, as well as those that have been dissolved or which modify capital.

These statistics were created by Order on September 30, 1938, and were last amended in 1990. They are collected monthly throughout the nation based on the information sent by the Central Mercantile Register on all the registered transactions relative to the companies which have been created, modified their capital or dissolved.

Suspension of Payments and Declared Bankruptcies

These statistics supply information on the number of companies which are in a situation of suspension of payments or declared bankruptcies, as well as the passive capital affected by the said situation.

The statistic was created by Royal Order issued on August 29, 1923, and was last amended on January 1, 1993. Their scope covers the entire country monthly. The sources of information are the Courts of First Instance and the Courts of First Instance and the Courts of First Instance and Instruction.

⁽P) Provisional estimate

Spain National Accounts

The objective is to provide a fully quantified, systematic and detailed representation of the Spanish economy, its components and its relation to other economies. INE has been producing the National Accounts since 1964.

National Accounts are composed of a consistent and integrated set of macro-economic accounts and tables based on a series of internationally accepted accounting concepts, definitions, classifications and rules. CNE-95 follows the guidelines established by the European System of Accounts (ESA95) used by all European Union member countries, thus enabling comparison of the economic structures of the different member countries and the implementation of integrated policies passed by the EU.

Institutional units, added in institutional sectors, are used to describe income and expenditure flows and financial flows, the study of behavioural relations in the field of revenue, final expenditure and financial transactions is called institutional analysis.

Gross Domestic Product at market prices (GDPmp)

It is one of the principal economic aggregates contained in the SNA, as it represents, globally, the total result of the productive activity in an economy.

It can be defined in three manners:

- The GDP equals the sum of the gross added values for the various institutional sectors or for the different branches of activity, plus the taxes on products, minus the subsidies on products.

- The GDP equals the sum of the final domestic use of goods and services (effective final consumption and gross capital formation) plus exports and minus imports of goods and services.
- The GDP equals the sum of employee's salaries, gross operating profit and gross mixed income and taxes, minus subsidies on products and imports for the whole of the economy.

Spain Regional Accounts

This statistical operation has been conducted by the INE since 1986 whose primary objective is to offer a quantified, systematic and as complete as possible a description of regional economic activity in Spain (autonomous communities and provinces). The information provided permits the analysis and evaluation of the regional economies structure and evolution. It also serves as a statistical base for the design, execution and tracking of regional policies.

The regional accounts are a specification of the national accounts; that is to say, the Spanish National Accounts (SNA) constitute the conceptual and quantitative frame of reference in which the Spanish Regional Accounts (SRA) is integrated.

Quarterly National Accounts (QNA)

These are statistics summarising the current economic situation, which objective is to give a consistent quantitative description of total Spanish economic activity in the immediate past. This involves quarterly estimates of the country's principal macroeconomic aggregates, employing the same principles of accounting consistency and balance as the annual NAS (National Accounts of Spain).

The QNA, produced by INE since 1.992, are a simplified quarterly copy of the National Accounts System, and therefore the quantitative and methodological aspect of the estimates should be consistent with the NAS. Methodological consistency is guaranteed by employing the same set of definitions, accounting conventions and weighting structures and by the use of basic statistical information from the same sources. Quantitative consistency is ensured by the existence of a longitudinal constraint demanding that the sum of the four QNA estimates for a given year be equal to aggregated result supplied by the NAS for the same year.

Furthermore, the variables measured in the QNA are subject to the same definitions and conventions as the ESA, applicable in the European Union, which means that results are comparable with those of other EUROSTAT countries.
