

Press Release

29 August 2008

#### **Retail Trade Indices. Base 2005** July 2008. Provisional data

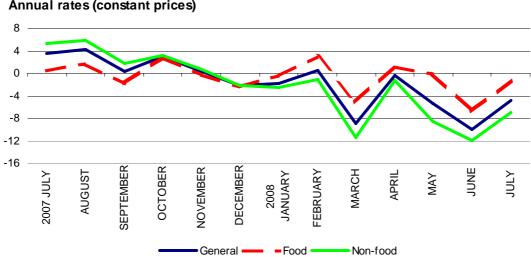

### Retail trade at constant prices decreases 4.8% in July, as compared with the same month in 2007

The general retail trade index in constant terms (in other words, after adjusting the prices' effect) registered an interannual decrease of 4.8% in sales in the month of July. Food products decreased 1.2%, and non-food products fell 7.0%. A breakdown of the latter by type of product revealed rates of 2.2% in Personal equipment, -11.5% in Household equipment and -5.0% in Other goods.

After eliminating the calendar effect i.e. the difference between the number of working days in a given month in different years, the retail trade index at constant prices showed a 6.0% decrease.

Annual rates (constant prices)

# The large chain stores are the only type of trade distribution whose sales increase as compared with the previous year

The breakdown of the general index of the retail sector, by distribution class, showed that all trade formulas decreased their sales as compared with the previous year, with the exception of large chain stores, which showed a positive interannual rate (0.9%).

#### **Retail sales decrease in all Autonomous Communities**

In all Autonomous Communities, retail sales decreased in constant terms, as compared with the same month the previous year. The Communities registering the smallest decreases were Castilla y León and Extremadura (both with -1.5%). In turn, those registering the largest decreases were La Rioja (-7.7%) and Región de Murcia (-7.5%).

#### Employment in the retail sector decreases 0.1% in July

In July 2008, the retail trade sector employment index (which shows the evolution for both paid and unpaid workers) registered an interannual variation rate of -0.1% for the sector as a whole. Large chain stores (3.2%) and department stores (1.3%) were the only distribution classes registering positive interannual rates.

## Methodological note

The evolution of the different classes of trade distribution raises the need to study the retail trade sector according to the characteristics of the company, in particular regarding the number of premises or establishments through which sales to final consumers are made.

For this purpose, the National Statistics Institute has extended its analysis, not only studying Department Stores, that is, sales made in premises larger than 2,500 m<sup>2</sup>, but also differentiating between *single retail stores, small chain stores and large chain stores*. The definitions used for each are as follows:

- **Single retail stores**: those that carry out their trade activity through a single premises that is smaller than 2,500 metres square.

- Small chain stores: those companies with more than one premises, with the exception of those with 25 premises or more and 50 employees or more. The small chain store index measures the evolution of the turnover that these companies obtain in their premises that are smaller than 2,500 metres square.

- Large chain stores: are companies with 25 or more outlets and 50 or more employees. The large chain store index measures the evolution of the turnover that these companies obtain in their premises which are smaller than 2,500 metres square.

The indices compiled for each of these groups follow the methodology used in the rest of the indicators compiled for retail trade, and they are published only on a national level, both at current prices and at constant prices. The base year is the year 2005, and data is available as of January 2006, which may be viewed on the INE website.
