Eustat – Basque Statistics Office,  
Vitoria-Gasteiz, Spain

# Labour Force Survey ( PRA ) in the Basque Country

- Continuous survey, since 1985, in the Basque Country,
- 1/8 quarterly rotation panel
- Designed to obtain quarterly estimates
- Evolution of the activity at province level
  
- Challenges:
  - more geographical disaggregation
  - better estimates of some subpopulations
  - reconciliation with administrative/other statistical sources

# Administrative Data: Population Register and Labour Market Registers

## Administrative Registers:

- Population Register, population base or sampling frame (Resident population)
- Quarterly record linkage:
  - Social Security affiliation (employees records) and
  - Registered unemployed workers in the Basque Employment Service (LANBIDE)
- As a result, .....

# Administrative data for sampling design

## SAMPLING FRAME

- Balanced sample, socio-demographic and labour characteristics.
- Balance variables: sex, age groups, family size, nationality, affiliation to the Social Security system and unemployment register variables.
- Cube Method (Déville and Tillé, 2004).

## Other improvements:

- More strata, from provinces (3) to capitals and groups of municipalities (20 statistical regions).
- Allocation in strata according to nonresponse
- Sample-size changes (from 5.088 to 6.300 household)
- Temporary division of the sample (13 weeks, and 7 days/week)

# Administrative Data and Calibration

The unit sampling weight is adjusted or calibrated to:

- population structure, both for individuals and families: age groups, sex, family size, week and wave.
- employment and unemployed totals in our population frame for: sex, age, provinces, nationalities, and working activity and professional situation.

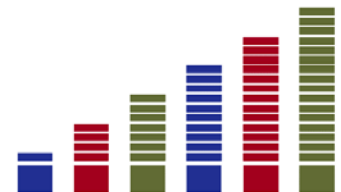

The methodological change for calibrating survey data has involved a change in the tasks (Record linkage).

Calibration process, very demanding in human and IT resources.

## Balance and future developments

- More accurate estimates, for various groups, as consequence of balanced sampling and calibration.
- and moreover, several administrative sources and the survey have been reconciled, meaning we can explain the changes in employment flows.
- In general, the whole process is demanding in terms of time and resources of all kinds.

Thank you very much for your attention!!
